

# PREDICTING HOUSE PRICES USING ML

*Development part 2*

Name: M.K. Karthikeyan

NMID : au513521106010

CLG: AMCET

PROJECT: PHASE 4

- **Data cleaning** can be applied to filling in missing values, remove noise, resolving inconsistencies, identifying and removing outliers in the data.
- **Data integration** merges data from multiple sources into a coherent data store, such as a data warehouse.
- **Data transformations**, such as normalization, may be applied. For example, normalization may improve the accuracy and efficiency of mining algorithms involving distance measurements.
- **Data reduction** can reduce the data size by eliminating redundant features, or clustering, for instance.

**Reference:** Data Mining: Concepts and Techniques  
Second Edition, Jiawei Han, Micheline Kamber.

**PS:** This is my first kaggle notebook contribution.  
Hope you like it!!

There are a number of data preprocessing techniques available such as,

1. **Data Cleaning**
2. **Data Integration**
3. **Data Transformation**
4. **Data Reduction**

**Data transformation**       $-2, 32, 100, 59, 48 \longrightarrow -0.02, 0.32, 1.00, 0.59, 0.48$

```
def find_missing_percent(data):
    """
    Returns dataframe containing the total missing values and percentage of total missing values of a column.
    """
    miss_df = pd.DataFrame({'ColumnName':[], 'TotalMissingVals':[], 'PercentMissing':[]})
    for col in data.columns:
        sum_miss_val = data[col].isnull().sum()
        percent_miss_val = round((sum_miss_val/data.shape[0])*100,2)
        miss_df = miss_df.append(dict(zip(miss_df.columns, [col, sum_miss_val, percent_miss_val])), ignore_index=True)
    return miss_df
```

# DATASET

Here we have web scrapped the Data from 99acres.com website which is one of the leading real estate websites operating in INDIA.

Our Data contains Bombay Houses only.

**Dataset looks as follows-**

	Price	PricePerSqft	Area_Sqm	Location	Bedrooms	Latitude	Longitude	PricePerSqM
0	13300000	16625	74.32	Kandivali (East)	2	19.210200	72.864891	178885.00
1	9000000	15666	55.74	Ramgad Nagar	1	19.167700	72.949300	168566.16
2	9000000	19148	43.66	Mahakali Caves	1	19.130609	72.873816	206032.48
3	9000000	10588	78.97	Louis Wadi	2	19.126005	72.825052	113926.88
4	100000000	20000	464.51	Barrister Nath Pai Nagar	5	19.075014	72.907571	215200.00

### 3. Multivariable Analysis

Let's check out all the variables! There are two types of features in housing data, categorical and numerical.

Categorical data is just like it sounds. It is in categories. It isn't necessarily linear, but it follows some kind of pattern. For example, take a feature of "Downtown". The response is either "Near", "Far", "Yes", and "No". Back then, living in downtown usually meant that you couldn't afford to live in uptown. Thus, it could be implied that downtown establishments cost less to live in. However, today, that is not the case. (Thank you, hipsters!) So we can't really establish any particular order of response to be "better" or "worse" than the other.

Numerical data is data in number form. (Who could have thought!) These features are in a linear relationship with each other. For example, a 2,000 square foot place is 2 times "bigger" than a 1,000 square foot place. Plain and simple. Simple and
